

Recycling System for Thermoplastic Membranes

## **Press Article**

15 March 2016

### Shared exhibition stand "Campaign PVC Recycling" on Demolition Conference

#### **Increasing interest in recycling solutions**

The campaign PVC recycling has again had a successful time at the „Demolition Conference“ on 4 and 5 March in Berlin, where German and European solutions were shown for floor coverings, roofing membranes, windows, roller shutters, coated fabrics as well as for pipes made from PVC.

“The trend to separate the individual materials already on renovation or demolition site in order to gain valuable new raw materials picks up speed. Interest in our recycling solutions grows considerably. We saw a distinct rise in both the number and quality of our contacts,” noted a happy Dr. Jochen Zimmermann, Managing Director of the AgPR, the recycling company of the flooring producers, which has been operating for more than 25 years.

#### **An important target group**

The demolition companies as supplier for potential raw materials are very important contact persons. “We need them to implement successfully our recycling solutions,” stated Michael Vetter, Managing Director of Rewindo GmbH, responsible for the recycling of old windows, roller shutters and doors. “The annual conference organised by the German Demolition Association (DAV) is a great opportunity to talk directly to managers of participating companies and to present them our possibilities.”

### **Practical implementation**

Practical solutions are offered on the market with nationwide collection systems for flooring, roofing membranes or windows - according to the requirements on the construction site and easy implementation for demolition companies. "You can order collection of end-of-life roofing and waterproofing membranes on our website or by sending an email or a fax to our logistics agent," reports Karin Arz, Managing Director of ROOFCOLLECT, the collecting and recycling system for roofing membranes. As a recycling specialist she was quite in demand as a competent contact person in Berlin and assured the real-life relevance of the material: based on reference samples from different renovation sites she explained to the visitors exactly what must be taken into consideration on the demolition site so that the membranes will be fit for recycling.
